NTE7227 Integrated Circuit Fixed Multi-Output Positive Voltage Regulator 10-Lead SIP

Description:

The NTE7227 is a multi-output positive voltage regulator in a 10-Lead SIP type package designed to provide fixed precision output voltages of 3.3V & 8V at current up to 0.5A and 5.1V at current up to 1A with an external PNP transistor. An internal reset circuit generates a reset pulse when Output 1 decreases below the regulated value. Output 2 and Output 3 can be disabled by TTL input. Protection features include over voltage protection, short circuit protection and thermal shutdown.

Features:

- Output Currents up to 0.5A (Output 1 & Output 2)
- Output Current up to 1A with External Transistor (Output 3)
- Fixed Precision Output 1 Voltage 3.3V ±2%
- Fixed Precision Output 2 Voltage 8V ±2%
- Control Signal Generator for Output 3 Voltage (5.1V ±2%)
- Reset Facility for Output Voltage 1
- Output 2 and Output 3 with Disable by TTL Input
- Current Limit Protection at Each Output
- Thermal Shutdown

Absolute Maximum Ratings:

DC Input Voltage, V_{IN}	20V
Disable Input Voltage, V_C	20V
Output Current, I_O	0.5A
Power Dissipation (No Heatsink), P_D	1.5W
Junction Temperature, T_J	+150°C
Operating Temperature Range, T_{opr}	0° to +125°C

Electrical Characteristics: ($V_{IN1} = 6V$, $V_{IN2} = 10.5V$, $T_J = +25^\circ C$ unless otherwise specified)

Quiescent Current	I_q	$I_{O1} = 10mA$, Output 2 Disabled	-	-	2	mA	
Reset Threshold Voltage	V_r	$K = V_{O1}$	K-0.4	K-0.25	K-0.1	V	
Reset Threshold Hysteresis	V_{rth}	Note 1	20	50	100	mA	

Note 1. To check the reset circuit, the reset output is low to discharge the delay capacitor ($= C_D$). If it's less than $V_{O1} - 0.25V$. And the reset output is high when the delay capacitor voltage linearly increased by the internal current source ($10\mu A$) if it's more than $V_{O1} - 0.2V$. The equations of delay time is the same as below. $T_{rd} = (C_D \times 2.5) / 10\mu A$.

Note 2. These parameters, although guaranteed, are not 100% tested in production.
