NTE7197 **Integrated Circuit** **High-Performance 68W Audio Power Amplifier ^w/Mute**

Description:

The NTE7197 is a high-performance audio power amplifier in an 11-Lead Staggered SIP type package capable of delivering 68W of continuous average power to a 4Ω load and 38W into 8Ω with 0.1% THD+N from 20Hz to 20kHz.

The performance of the NTE7197, utilizing proprietary protection circuitry, puts it in a class above discrete and hybrid amplifiers by providing an inherently, dynamically protected Safe Operating Area (SOA). This protection means that these devices are completely safeguarded at the output against overvoltage, undervoltage, overloads, including shorts to the supplies, thermal runaway, and instantaneous temperature peaks.

The NTE7197 maintains an excellent signal-to-noise ratio of greater than 92dB with a typical low noise floor of 2.0μV. It exhibits extremely low THD+N values of 0.03% at the rated output into the rated load over the audio spectrum, and provides excellent linearity with an IMD (SMPTE) typical rating of 0.004%.

Features:

- Continuous Average Output Power:
 - 68W into 4Ω at $V_{CC} = \pm 28V$
 - 38W into 8Ω at $V_{CC} = \pm 28V$
 - 50W into 8Ω at $V_{CC} = \pm 35V$
- 135W Instantaneous Peak Output Power Capability
- Signal-to-Noise Ratio $\geq 92dB$
- An Input Mute Function
- Output Protection from a Short to GND or to the Supplies via Internal Current Limiting Circuitry
- Output Overvoltage Protection Against Transients from Inductive Loads
- Supply Undervoltage Protection, not allowing Internal Biasing to occur when $|V_{EE}| + |V_{CC}| \leq 12V$, thus Eliminating Turn-On and Turn-Off Transients
- Wide Supply Range: +20V to +90V

Applications:

- Component Stereo
- Compact Stereo
- Self-Powered Speakers
- Surround-Sound Amplifiers
- High-End Stereo TVs

Absolute Maximum Ratings: (Note 1, Note 2)

Supply Voltage, $ V+ + V- $	94V
No Signal	84V
Input Signal	84V
Common Mode Input Voltage	(V+ or V-) and $ V+ + V- \leq 80V$
Differential Input Voltage (Note 3)	60V
Output Current	Internally Limited
Power Dissipation (Note 4), P_D	125W
ESD Susceptibility (Note 5)	3000V
Operating Junction Temperature (Note 6), T_J	+150°C
Lead Temperature (During soldering, 10sec), T_L	+260°C
Thermal Resistance, Junction-to-Case, R_{thJC}	1°C/W
Thermal Resistance, Junction-to-Ambient, R_{thJA}	43°C/W

- Note 1. All voltages are measured with respect to the GND pin (Pin7), unless otherwise specified.
- Note 2. Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. Electrical Characteristics state DC and AC electrical specifications under particular test conditions which guarantee specific performance limits. This assumes that the device is within the Operating Ratings. Specifications are not guaranteed for parameters where no limit is given, however, the typical value is a good indication of device performance.
- Note 3. The differential input voltage Absolute Maximum Rating is based on supply voltages of $V+ = +40V$ and $V- = -40V$.
- Note 4. For operating at case temperatures above +25°C, the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of $R_{thJC} = 1.0°C/W$ (junction-to-case).
- Note 5. Human body model, 100pF discharged through a 1.5kΩ resistor.
- Note 6. The operating junction temperature maximum is +150°C, however, the instantaneous surge Operating Area temperature is +250°C.

Operating Ratings: (Note 1)

Supply Voltage, $ V+ + V- $	+20 to +84V

Note 1. All voltages are measured with respect to the GND pin (Pin7), unless otherwise specified.

Note 8. The feedback compensation network limits the bandwidth of the closed-loop response and so the slew rate will be reduced due to the high frequency roll-off. Without feedback compensation, the slew rate is typically larger.

Note 9. The output dropout voltage is the supply voltage minus the clipping voltage.
