NTE6860 Integrated Circuit NMOS – FSK Digital Modem, 600bps

Description:

The NTE6860 is a MOS subsystem in a 24-Lead DIP type plastic package designed to be integrated into a wide range of equipment utilizing serial data communications.

The modem provides the necessary modulation, demodulation and supervisory control functions to implement a serial data communications link, over a voice grade channel, utilizing frequency shift keying (FSK) at bit rates up to 600 bps. The NTE6860 can be implemented into a wide range of data handling systems, including stand alone modems, data storage devices, remote data communication terminals and I/O interfaces for minicomputers.

N-channel silicon-gate technology permits the NTE6860 to operate using a single-voltage supply and be fully TTL compatible.

The modem is compatible with the NTE6860 microcomputer family, interfacing directly with the Asynchronous Communications Interface Adapter to provide low-speed data communications capability.

Features:

- Originate and Answer Mode
- Crystal or External Reference Control
- Modem Self Test
- Terminal Interfaces TTL-Compatible
- Full-Duplex or Half-Duplex Operation
- Automatic Answer and Disconnect
- Compatible Functions for 100 Series Data Sets
- Compatible Functions for 1001A/B Data Couplers

Absolute Maximum Ratings:

| | |
|---|----------------|
| Supply Voltage, V_{CC} | -0.3 to +7.0V |
| Input Voltage, V_{in} | -0.3 to +7.0V |
| Operating Temperature Range, T_A | 0° to 70°C |
| Storage Temperature Range, T_{stg} | -55° to +150°C |
| Thermal Resistance, Junction-to-Ambient, R_{thJA} | +120°C/W |

Note 1. This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (e.g. either V_{SS} or V_{CC}).

Power Considerations:

The average chip-junction temperature, T_J , in °C can be obtained from:

$$1. T_J = T_A + (P_D \cdot R_{\theta JA})$$

Where:

T_A ≡ Ambient Temperature, °C

$R_{\theta JA}$ ≡ Package Thermal Resistance, Junction to Ambient, °C/W

P_D ≡ $P_{INT} + P_{PORT}$

P_{INT} ≡ $i_{CC} \times V_{CC}$, Watts – Chip Internal Power

P_{PORT} ≡ Port Power Dissipation, Watts – User Determined

For most applications $P_{PORT} \ll P_{INT}$ and can be neglected. P_{PORT} may become significant if the device is configured to drive Darlington bases or sink LED loads.

An approximate relationship between P_D and T_J (if P_{PORT} is neglected) is:

$$2. P_D = K \div (T_J + 273^\circ\text{C})$$

Solving equations 1 and 2 for K gives:

$$3. K = P_D \cdot (T_A + 273^\circ\text{C}) + R_{\theta JA} \cdot P_D^2$$

Where K is a constant pertaining to the particular part. K can be determined from equation 3 by measuring P_D (at equilibrium) for a known T_A . Using this value of K the values of P_D and T_J can be obtained by solving equations 1 and 2 iteratively for any value of T_A .

DC Electrical Characteristics: ($V_{CC} = 5V \pm 5\%$, all voltages referenced to $V_{SS} = 0$, $T_A = 0^\circ$ to $+70^\circ\text{C}$ unless otherwise specified)

| Parameter | Symbol | Test Conditions | Min | Typ | Max | Unit |
|--|-----------|---|----------|------|----------|---------------|
| Input High Voltage | V_{IH} | All Inputs Except Crystal | 2.0 | – | V_{CC} | V |
| Input Low Voltage | V_{IL} | All Inputs Except Crystal | V_{SS} | – | 0.80 | V |
| Crystal Input Voltage | V_{in} | Crystal Input Driven from an External Reference, Input Coupling Capacitor = 200pF, Duty Cycle = 50 ±5% | 1.5 | – | 2.0 | V_{P-P} |
| Input Current | I_{in} | $V_{in} = V_{SS}$ All Inputs Except Rx Car, Tx Data, \overline{TD} , TST, \overline{RI} , \overline{SH} | – | – | –0.2 | mA |
| | | \overline{RI} , \overline{SH} Inputs | – | – | –1.6 | mA |
| Input Leakage Current | I_{IL} | $V_{in} = 7V$, $V_{CC} = V_{SS}$, $T_A = +25^\circ\text{C}$ | – | – | 1.0 | μA |
| Output High Voltage | V_{OH1} | All Outputs Except An Ph and Tx Car, $I_{OH1} = -0.04\text{mA}$, Load A | 2.4 | – | V_{CC} | V |
| Output Low Voltage | V_{OL1} | All Outputs Except An Ph and Tx Car, $I_{OL1} = 1.6\text{mA}$, Load A | V_{SS} | – | 0.40 | V |
| | | An Ph, $I_{OL2} = 0$, Load B | V_{SS} | – | 0.30 | V |
| Output High Current | I_{OH2} | An Ph, $V_{OH2} = 0.8V$, Load B | 0.30 | – | – | mA |
| Input Capacitance | C_{in} | $f = 0.1\text{Mhz}$, $T_A = +25^\circ\text{C}$ | – | 5.0 | – | pF |
| Output Capacitance | C_{out} | $f = 0.1\text{Mhz}$, $T_A = +25^\circ\text{C}$ | – | 10 | – | pF |
| Transmit Carrier Output Voltage | V_{CO} | Load C | 0.20 | 0.35 | 0.50 | V_{RMS} |
| Transmit Carrier Output 2 nd Harmonic | V_{2H} | Load C | –25 | –32 | – | dB |
| Input Transition Times | t_r | All Inputs Except Crystal, Operating in the Crystal Input Mode; from 10% to 90% Points, Note 2 | – | – | 1.0 | μs |
| | | | – | – | 1.0 | μs |
| | t_f | Crystal Input, Operating in External Input Reference Mode | – | – | 30 | μs |
| | | | – | – | 30 | μs |
| Output Transition Times | t_r | All Outputs Except Tx Car, From 10% to 90% Points | – | – | 5.0 | μs |
| | | | – | – | 5.0 | μs |
| Internal Power Dissipation | P_{INT} | All Inputs at V_{SS} and All Outputs Open, $T_A = 0^\circ\text{C}$ | – | – | 340 | mW |

Note 2. Maximum Input Transition Times are $\leq 0.1 \times$ Pulse Width or the specified maximum of 1 μs , whichever is smaller.

Output Test Loads

Load A: TTL Output Load for Receive Break, Digital Carrier, Mode, Clear-to-Send, and Receive Data Outputs

Load B: Answer Phone Load

Load C: Transmit Carrier Load

$C_T = 20\text{pF}$ = total parasitic capacitance, which includes probe, wiring, and load capacitance
